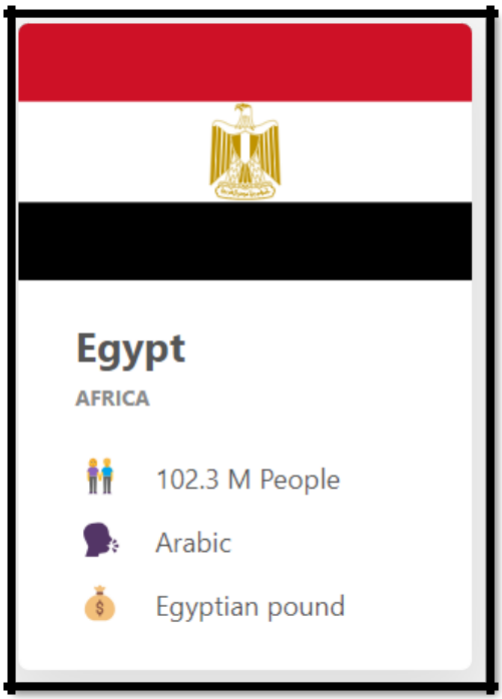
Lab3

1- *use rest countries API to get any country's data by country name*

https://restcountries.com/v2/name/{countryname}

and display the result as follow

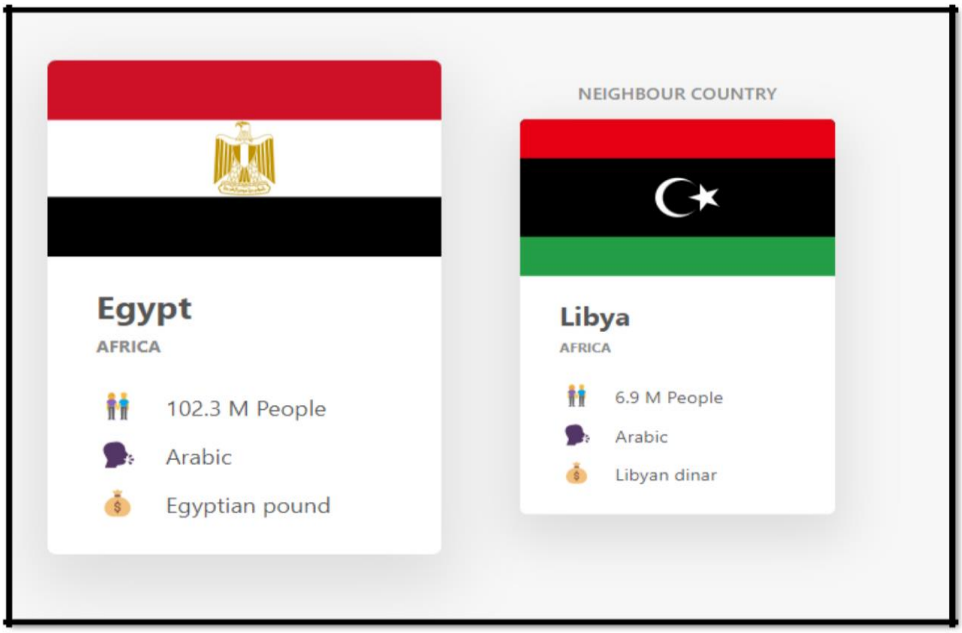
for example: https://restcountries.com/v2/name/Egypt



2- *from assignment 1 now using chaining promises (a promise that depends on another promise) to display one neighbor country*

https://restcountries.com/v2/alpha/{neighbour}

as shown but make it dynamically called from the value that was returned from the Country promise (don't type the name of the neighbor manually).

3-Search and write Adamo to explain promise constructor functions:


a- Promise.any()
b- Promise.all()
C- Promise.allSettled()
D- Promise.race()
