PartOne:

1-Build a todoList object: Create an object todoList that manages a list of tasks. It should have:

- A property tasks (an array, initially empty) to hold the task names.
- A method addTask(task) that adds a new task to the list.
- A method removeTask(task) that removes a task by name.
- A method listTasks() that logs all tasks to the console (one per line).

PartTwo:

Build User Profile Object :

- Create a user object with properties name (string) and age (number).
- Inside it, add a nested object address with properties street and city.
- Then add a method getFullAddress() that returns the full address as a string (e.g., "123 Main St, Anytown").

PartThree :

-depend on PartTwo

-Build Your UserProfileManger Object with properties :

-ArrayOfUserProfileObjects

-Method To Print UserPfiles

-Method AddingNewUserPfile Take UserProfileObject

-Method RemoveUSerProfile Take UserProfileId As Param

-Method To Filter Get the UserProfileObject with the same Name As Input

-Method to Sorting UserProfiles By Id and anthor One By Name

- Build Your Form To Take UserProfileData From form Inputs (*with validation* 😊)

-Try All UserProfileManger Method With At Least 5 Of USers
